

# MAGNETIC FIXATION DEVICE “Praktik”

## *User's manual*

Already for a long time, both for many professional and recreational fishermen, successful fishing is associated with sonar device Praktik. More and more people wish to try out all the advantages and opportunities of modern technology. This has contributed to rapid increase of popularity of sonars amongst fishermen.

The company Praktik-NC is involved in developing and producing domestic sonars. In our work, we take into consideration the interests and needs of fishermen of any level. We have separately developed unique sets especially made for fishing in summer or in winter. These sets mostly differ in the fixation type of hydro locator elements, construction and working principles which depend on actual working conditions.

Magnetic fixation device Pratik is rightfully considered to be the best monitor fixation device. It consists of:

- wide rubbery cord with adjusting velcro fastening zipper (1)
- stainless metal plate (2)
- powerful neodymium magnet (3)

Such fixation system allows to install the device monitor at the most visible location. Fixation device prevents the device from falling down or in the water, thus protecting the sensitive elements of the sonar.

The most optimal models for fishing during cold season are winter sonars Praktik: ER-6 and ER-6 Pro. After descending the transducer under the ice, the user will have an opportunity to get to know the water body covered by ice in detail. Such mini-computer will provide the fisherman with sufficient data about the bottom structure, depth of the water body and existence of fish in the specific location of the expected fishing site.

Domestic sonars are undeniably cheaper than their foreign analogs. Despite of this, such a wonderful device should be mounted as securely as possible.

## LET'S PREPARE THE MAGNETIC FIXATION DEVICE FOR USE

We recommend you to prepare the magnetic fixation device for use already before going to fishing at home.

The following steps should be followed:

- Tape the metal plate correctly to the device by removing the protective film from it first.
- If the device has been in use, please remove the possible grease from the connection site.

The following activities should be performed when you are already directly on the ice. If desired by the fisherman, the cord attached to the device can be fixed on your arm or leg.

- Pull the cord tightly on your clothes, keeping down the side that ensures an anti-slip effect.
- Fix the cord with velcro fastening, then attach the device to the magnet.
- Match the protruding screws of the fixation device with the holes in the plate. Now, even abrupt movements cannot lead to displacement of the sonar.

**In order to get lots of positive emotions and a respectable catch from fishing in winter and in summer, don't forget to bring sonar PRAKTIK with a secure magnetic fixation device and special case „Pratik“.**
